RoadPilot[®]
microGo[™]

the world's smallest "plug and go"
GPS speed camera warning system

Covers all of the UK speed cameras and
a growing number in mainland Europe*

RoadPilot[®] microGo™

microGo is the world's smallest GPS speed camera warning system. Using the latest GPS technology it comes ready loaded with RoadPilot's database of speed camera locations and accident black spots in the UK and a growing number of European countries.

microGo is ready to use - straight from the box. Simply plug the power lead into your lighter socket and you are ready to go. This plug-and-go ability makes it easy to move the microGo from vehicle to vehicle.

When you approach a speed camera, microGo gives an audible and visual warning. An "Alert" sound is immediately followed by the words "Speed Camera, Speed Limit 40"... or 50, or 70 etc.

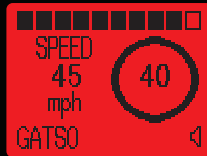

If you are driving faster than the permitted speed, microGo advises you to slow down until you've reached the permitted speed. If you are under the speed limit only an early warning is given.

The display indicates the permitted speed AND your actual speed at the same time. It also indicates how close you are to the camera.

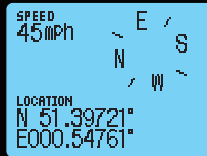

If you are under the speed limit the microGo simply informs you of the speed camera.

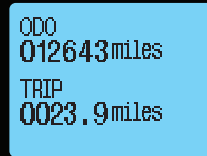

Speed Display
Uses the GPS satellites to calculate your speed over the ground with great precision. Displayed in mph or km/h (user selectable).

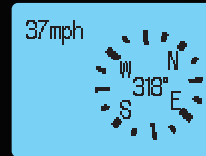

Camera Warning
Shows your speed and the road's speed limit. The bar graph indicates the range to the speed camera. Audible and visual warnings are given if you are exceeding the speed limit.

Rescue ME™
Useful for advising rescue services and roadside assistance of your exact position.

Trip Computer
Shows the Odometer and a resettable Trip Counter. Displayed in mph or km/h (user selectable).

Compass Heading
Shows your vehicle's heading as a rotating card "head up" compass display. Your current speed is also shown.

Congestion Charge
Gives an advance warning when approaching, on the boundary and while in the Congestion Charge Zone.

Max Speed Alarm
Activates when you exceed your personal speed limit (user selectable).

microGo the GPS speed camera warning system that allows you to change the colour of it's display.

With 64 colour options to choose from, you can set the display's backlight colour to match your car's instrument illumination. You can also set the colour of the visual alerts to change colour when microGo detects a speed camera, or when you exceed your personal speed limit. The one touch button is also illuminated for ease of use.

Set the display backlight to match the lighting of your vehicle's instruments.

* Countries currently included are:
 UK, Belgium, Luxembourg, Holland,
 France, Germany, Norway and Sweden.

Planned 2006 are:
 Spain, Italy, Austria, Switzerland and
 Finland.

Whether you agree with speed cameras or not, there are over 5,000 on our roads and last year 3,000,000 fines were issued amounting to more than £114,000,000 in fines.

Remember, over 50% of these cameras are in 30 mph zones - so you don't have to be "driving fast" to collect a fine.

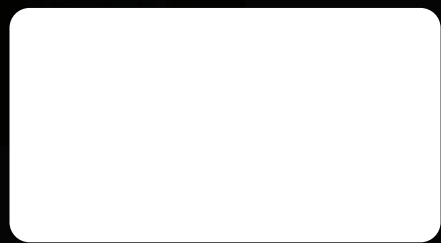

RoadPilot helps you to protect your licence and your livelihood. According to a recent MORI survey, drivers using speed-warning devices travelled 50% further between accidents than non users. The consequences of driving over the limit could result in a fine, an endorsement and a substantially increased insurance premium!

RoadPilot is the UK's leading supplier of speed camera location data. We employ a dedicated database team that constantly add new camera locations so that the database you use is always up to date. Even temporary cameras sited at road works are included. microGo comes delivered with the RoadPilot "Euro Database" of speed camera locations at no extra cost.

For extra protection, RoadPilot offers the compatible, 100% legal, LaserPilot - an optional laser detector providing a warning from handheld and mobile speed detection devices.

...all this adds up to the fact that you are in safe hands with RoadPilot.
